at speed testing dft. In DFT there should be ATPG, TFT mode. TFT mode is the at speed test, not the full speed test. In TFT test, U should employ PLL to generate at speed clock. generally use SCAN_EN to switch shift_clk and lauch/capture clock. actully the lauch/capture clock is the highest frequency in the design.

A Speed test measures your ping, and download and upload speeds. Measuring the latter two is essential because most ISPs make separate promises for download and upload speeds. Usually, the download speed features prominently, but if you dig into the details, the ISP typically specifies a slower upload speed for each level.

QoS is a big topic in itself, but in our context of bandwidth speed tests, QoS represents the ratio of the worst reading to the best one. It is, in fact, a measure of the level of consistency in download speed. In speed tests, it is represented as a percentage. The higher it is, the better to quality. For good VoIP, the QoS should be 80% or more.
