Abstract. Yeast, and especially *S. cerevisiae*, is a unique eukaryotic model organism for studying oxidative stress and its cellular responses.*S. cerevisiae* has become a very powerful tool to decipher the complexity of these biologically important responses, because it offers the relative simplicity of a single celled eukaryotic organism that enables the combination and integration of genetic ...

Next, we analyzed the role of Ser57 phosphorylation in the oxidative stress response. Wildtype yeast cells arrest growth in response to oxidative stress and activate responses that help cells cope with the proteotoxic and DNA damaging effects of oxidation (Silva et al., 2015; Shapira et al., 2004; Petti et al., 2011; Martindale and Holbrook, 2002).

The oxidative stress responses appear to be regulated, at least in part, at the level of transcription and there is considerable overlap between them and many diverse stress responses, allowing the yeast cell to integrate its response towards environmental stress.

As mentioned above, synthesis of glycerol is a major response of yeast cells to osmotic stress (see Ref. 30 for a review). In addition to the well characterized genes GPD1 and GPD2 , responsible for the synthesis of glycerol, we have detected a strong increase in expression in a number of genes encoding plasma membrane sugar transporters, such as STL1 , HXT10 , HXT7 , and HXT5 .

### The Transcriptional Response of Yeast to Saline Stress

While this system is now only available for stress response in yeast, we think that also other research topics can benefit from this system. To use the interactive workflows and reports for another biological system, the corresponding data sets have to be identified, processed and annotated to create the underlying database.

namely the environmental stress response (ESR), lar-gely mediated by the two transcription factors Msn2 and Msn4 [7]. Here, we review the response of the budding yeast *S. cerevisiae* to several different forms of stress highlighting, in particular, those in which the Yap family of basic-leucine zipper (b-ZIP) transactiva-tors play a role.

### The yeast stress response - FEB5 Press

Aneuploid cells experience significant cellular stress; however, the transcriptional consequences of aneuploidy remain highly debated. In aneuploid budding yeast, two opposing gene-expression patterns have been reported: the “environmental stress response” (ESR) and the “common aneuploidy gene-expression” (CAGE) signature, in which many ESR genes are oppositely regulated.
